## Basic Components of Talk

Project Goals

Last Years Efforts

Key Findings

Directions being Pursued

## Project Goals

Examine the portfolio of land based GHG mitigation strategies and identify ones for further scrutiny considering  
Afforestation, Forest management, Biofuel, Ag soil, Animals, Fertilization, Rice, Grassland expansion  
Manure, Crop mix

Look at market and time conditions under which strategies dominate

Educate on needed scope of economic analysis

Bring in a full cost and GHG accounting

Look at market effects and co benefits/ costs

## Activities in last year

### FASOM-GHG - examines Land based GHG strategies

| Strategy                      | Basic Nature  | CO2 | CH4 | N2O |
|-------------------------------|---------------|-----|-----|-----|
| Afforestation                 | Sequestration | X   |     |     |
| Existing timberland           | Sequestration | X   |     |     |
| Deforestation                 | Emission      | X   |     |     |
| Biofuel Production            | Offset        | X   | X   | X   |
| Crop Mix Alteration           | Emiss, Seq    | X   |     | X   |
| Crop Fertilization Alteration | Emiss, Seq    | X   |     | X   |
| Crop Input Alteration         | Emission      | X   |     | X   |
| Crop Tillage Alteration       | Emission      | X   |     | X   |
| Grassland Conversion          | Sequestration | X   |     |     |
| Irrigated /Dry land Mix       | Emission      | X   |     | X   |
| Enteric fermentation          | Emission      | X   |     |     |
| Livestock Herd Size           | Emission      | X   | X   |     |
| Livestock System Change       | Emission      | X   | X   |     |
| Manure Management             | Emission      |     | X   | X   |
| Rice Acreage                  | Emission      | X   | X   | X   |

## Activities in last year

FASOM-GHG - examines Land based GHG strategies

Dissertation by Heng-Chi Lee

Considers saturation characteristics of both soils and forests  
(uses 30 years for ag soils, Birdsey for forest soils  
and growth/yield characteristics of forests from forest  
service)

100 year model

Land exchanges in response to GHG prices, plus all the  
agricultural activities by decade

## Empirical examinations done in last year

Leakage

International Leakage in ag

Regional project appraisal

Favored regional activity identification

Co-benefits study

Simultaneities with climate change

Improved Non CO2 inventory

Ties to CGE

## Major Results

Portfolio

Dynamic role of strategies

Potential measures

Mitigation and Markets

Dynamics and co benefits

Favored regional activity identification

Simultaneities with climate change

Ties to CGE

## Portfolio Results

Millions of metric tons sequestered by source at alternative prices

| Activity          | GHG Price (\$/ton C) |      |       |       |       |       |
|-------------------|----------------------|------|-------|-------|-------|-------|
|                   | \$5                  | \$10 | \$25  | \$50  | \$100 | \$200 |
| Soil Management   | 28.7                 | 33.7 | 41.5  | 43.0  | 37.8  | 27.0  |
| Afforestation     | 1.0                  | 3.8  | 53.0  | 156.3 | 366.2 | 358.2 |
| Forest Management | 7.0                  | 11.2 | 12.9  | -0.6  | 7.8   | 62.0  |
| Biofuel Offsets   | 0.0                  | 0.0  | 1.5   | 162.9 | 233.7 | 375.1 |
| CH4+N2O Reduction | 2.1                  | 2.9  | 6.1   | 17.1  | 34.4  | 43.0  |
| Other Activities  | 1.7                  | 2.1  | 3.9   | 13.8  | 18.6  | 22.4  |
| Total             | 42.4                 | 55.5 | 121.7 | 394.9 | 700.8 | 890.7 |

Sectors can make a difference

## Portfolio Results

MMt arising at an offset price giving \$/tonne carbon equiv

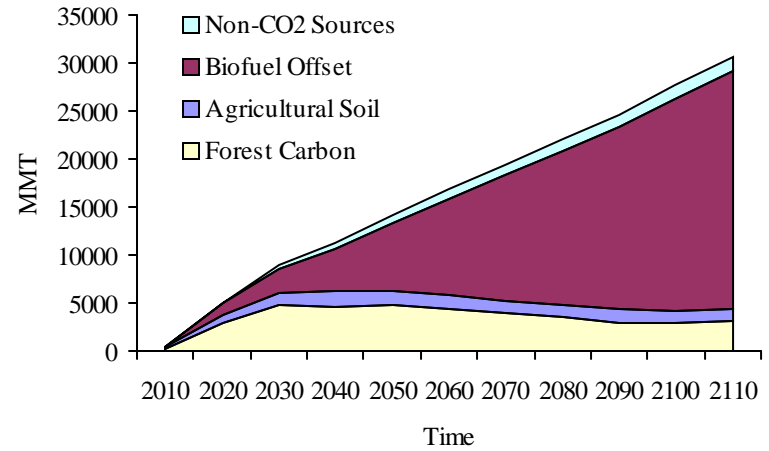

- Small importance of CH<sub>4</sub> and N<sub>2</sub>O
- Different strategies dominate at different price levels

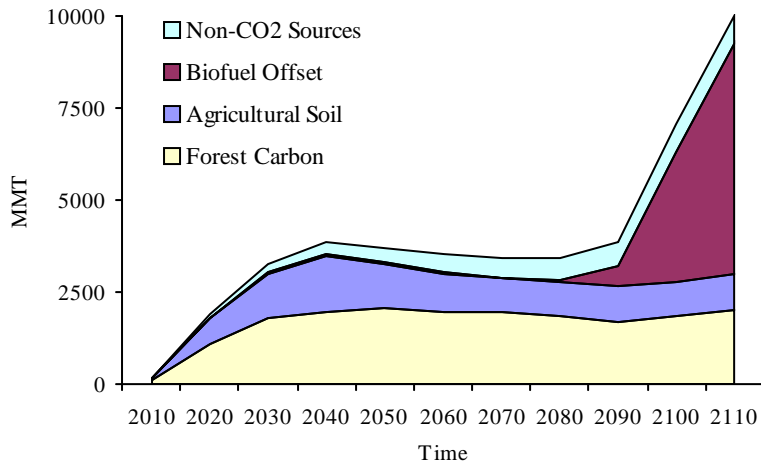

# Dynamic role of strategies Results

**Cumulative Contribution at a \$10 Price**

**Cumulative Contribution at a \$50 Price**

**Cumulative Contribution at a \$25 Price**

**Cumulative Contribution at a \$100 Price**

## Potential measures Results

### Economic vs competitive potential

Annual Soil Carbon Sequestration on Crop Land

Annual Carbon Sequestration in Forest Sector

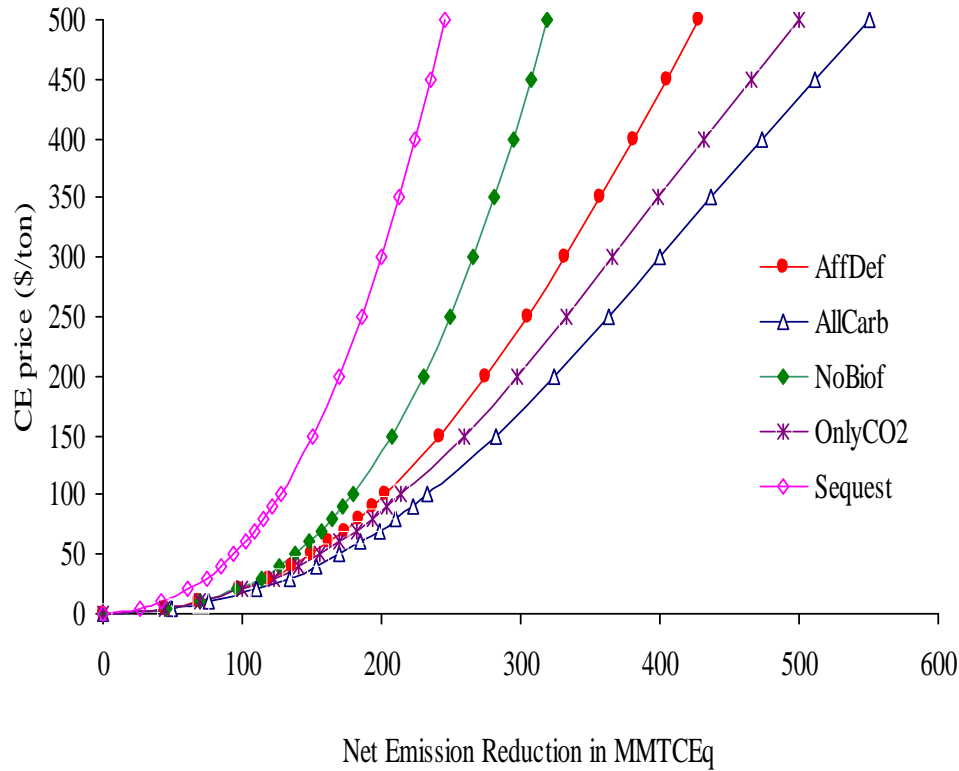

Economic potential is how much one would get if this was the only strategy employed

Competitive potential is how much one gets when other strategies are possible

Technical potential of ag soils is at 140 MMT

# Potential measures Results

## Implementation policy and response (from ASM summary)

- Affdef -- afforestation and deforestation only
- Allcarb -- all forestry and ag
- Nobiof -- no biofuels
- OnlyCO2 -- no non co2 gasses
- Sequest -- ag soils only

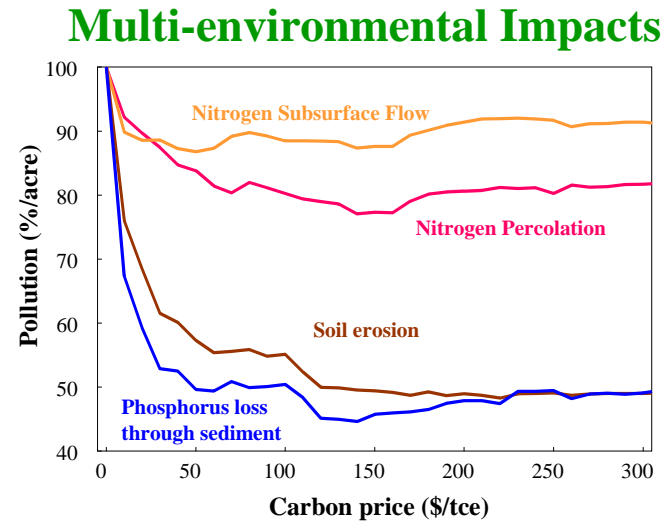

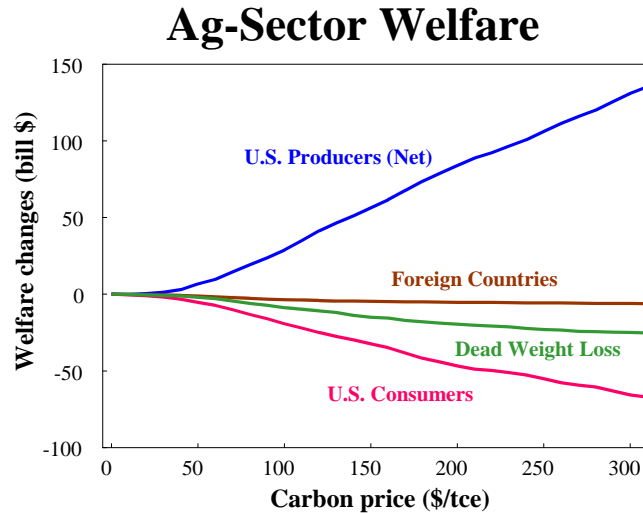

Mitigation and markets results

# GHG Mitigation and Ag-Markets

From ASMGHG

# Dynamics and co benefits results

High prices erode co benefits due to intensification

Producers gain

Consumers lose

Exports reduced

Some co benefits do not saturate over time but continue to be accrued (erosion, runoff, farm income). Ecosystem gains in habitat may saturate

From ASMGHG

# Regional Strategy Results

Largest opportunities by region and type

| Region/Type                 | \$5 | \$10 | \$25 | \$50 | \$100 | \$200 |
|-----------------------------|-----|------|------|------|-------|-------|
| CB-Soil Management          | 1   | 1    | 3    | 7    | 10    |       |
| SC-Forest Management        | 2   | 2    | 2    | 6    | 7     | 9     |
| LS-Soil Management          | 3   | 4    | 8    |      |       |       |

| RM-Afforestation Activities |     |      |      |      |       | 10    |

Regionally dominating strategies

## Simultaneities with climate change Results

### Climate Change Anticipation Effects on US Sequestration Rate: FASOM

- Projected climate change could substantially enhance C sequestration rates
- Strong synergies between climate change and C prices
- Need to consider feedback effects between sequestration, GHG concentrations, and climate change

## Ties to CGE Results

Developed response functions from ASMGHG sector model

To do this ran ASMGHG sectoral model multiple times  
under alternative levels for

carbon equivalent price,

agricultural commod. demand - domestic & export

fuel price

Yielding data on simultaneous production of

GHG offsets

AF commodity price and quantity

AF sectoral performance

Then we fit functions to those data to encapsulate the results

## Ties to CGE Results

### Estimation data

405 systematic scenarios of independent variables

15 alternative carbon eq. prices \$1, \$5, \$10, \$20,  
\$30, \$40, \$50, \$60, \$70, \$80, \$90, \$100,  
\$200, \$300, and \$400 per ton

3 levels of fuel prices            80%, 100%, 120% of base

3 levels of domestic demand   80%, 100%, 120% of base

3 levels of export demand      80%, 100%, 120% of base

another 100 random scenarios from the ranges above for each of  
the 4 items to build degrees of freedom

## Ties to CGE Results

### Estimated functions

#### *Quantity of GHG emissions and sinks.*

Emissions of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O (broken out to avoid double counting)

Sinks for CO<sub>2</sub> (did CH<sub>4</sub> but should not use?)

#### *Ag Production, exports, imports and price*

Fisher index tot ag production, exports, imports and price changes

Biofuel production

#### *Land Use, allocation and valuation.*

Acres crops, biofuels, pasture and forest, and choice of tillage practices.

#### *Welfare distribution.*

consumers' producers' and foreign interests.

#### *Levels of environmentally related items -*

use of crop land, irrig. water; nitrogen, phosphorus, potassium, pesticides,  
fossil fuels, water and wind erosion.

## Ties to CGE Results

### Functional form

$$Y_k = A_k \prod_i x_i^{s_{ki}} V_k$$

where

$A_k$  is the intercept term associated with the  $k$ th response function  
 $\beta_{ik}$  is a vector of parameters associated the vector  $\mathbf{x}$  of signals.

The base functions with all of the independent variables held at the base level  
1 for carbon price , 100 for the others

That depicts the ASMGHG output under a  
zero carbon price  
1997 energy price,  
1997 domestic demand,  
1997 export demand levels.

## Ties to CGE Results

| Dependent Variables                        | Intercept | Carbon Price | Agriculture Demand | Exports  | Fuel Price | R <sup>2</sup> |

\* Marks insignificant coefficients

## Directions being Pursued

### Other Costs of Strategies

Discounts for leakage, saturation, uncertainty additionality

Dynamic response functions from FASOM

Better ag carbon – Century, EPIC

Better forest carbon – Century, EPIC

Better non CO<sub>2</sub>

Improved animal emission accounting and management

Updated forest inventory and growth

CGE
